**Key words:** Cadastre; Capacity building; Digital cadastre; e-Governance; Land management; Professional practice; Cross country cooperation

## **SUMMARY**

The countries of the Western Balkan have the ambition to improve the access and harmonisation of their geospatial information. As (potential) candidate members of the European Union they also have obligations in relation to the spatial data infrastructure. The access and use of professional and reliable authoritative geospatial information will make the policy and decision making processes more efficient in the region.

Society in general will benefit from the transparent access to information. This will contribute to a stable and sustainable relation between the citizens and the government. The SPATIAL project will strengthen the professional access to information about land in the Western Balkans. Kadaster experts support their colleagues in the Western Balkan region in this project.

This paper will describe the approach used in the project and the result that were achieved.
